PROFESSIONAL SUMMARY

Software Engineer specializing in TypeScript, React Native, and full-stack web development. Proven track record of architecting and shipping production-ready mobile applications and resilient backend systems. Adept at handling complex state management, real-time WebSocket integrations, and cross-platform deployments. Focused on building scalable, high-performance interfaces and taking products from zero to live on the App Store and Google Play.

TECHNICAL SKILLS

Languages	TypeScript, JavaScript (ES6+), Node.js runtime, SQL, HTML5, CSS3
Frontend & UI	React, Next.js, Vue 3, React Native (Expo, EAS), State Reconciliation, Asynchronous State Management
Backend & Systems	Express.js, RESTful Architecture, PostgreSQL, Prisma ORM, MongoDB (Mongoose), Docker, WebSockets
Testing & Code QA	Jest, Integration Testing against Real DBs, Deterministic Edge-Case Test Harnesses, Git, Postman
Engineering Rigor	Concurrency Isolation, Idempotency, Static Type Soundness, Defensive Validation, Clean Architecture

SELECTED ENGINEERING PROJECTS

Kablux - Real-Time Mobility & Ride-Sharing Application **Google Play & App Store**

Contract Mobile Developer *Production Mobile App*

React Native, Expo EAS, WebSockets, Asynchronous Event Loops, State Reconciliation

- Shipped dual production client applications (Rider and Driver applications) to both the Google Play Store and Apple App Store, handling continuous bidirectional location streaming.
- Designed a resilient WebSocket event orchestration layer featuring automated reconnection queues and offline-first state reconciliation to maintain trip synchronization through network degradation.
- Isolated and resolved asynchronous state synchronization issues between high-frequency driver coordinate broadcasts and client-side map rendering loops.

LasuLearn - University E-Learning Platform **Production Web & Mobile**

Full-Stack & Mobile Developer

Next.js, React Native (Expo), TypeScript, REST APIs, EAS CI/CD

- Engineered and maintained production web (Next.js) and mobile (React Native/Expo) clients serving an active user base of 1,000+ university students for course access, assessment tracking, and live campus updates.
- Established shared TypeScript domain models and business logic layers across both web and mobile repositories, guaranteeing data contract fidelity and cutting cross-platform maintenance overhead.
- Enforced rigorous peer review standards across API consumption, state synchronization, and component hierarchy to preserve high modularity and eliminate regression defects before production EAS builds.
- Managed build pipelines, credentials, and app deployment workflows utilizing Expo Application Services (EAS) across diverse Android and iOS runtime targets.

Automated Student ID Card Attendance & Tracking System **Production Project**

Backend Systems Engineer

Node.js, Express, PostgreSQL, Prisma, Docker, Jest, JWT/MFA Security Architecture

- Architected a security-hardened backend using custom JWT access and HTTP-only refresh tokens, bcrypt password hashing, and staged multi-factor authentication (email verification, TOTP/MFA) deliberately engineered without heavyweight third-party abstractions.
- Resolved critical race conditions during simultaneous physical card scans by injecting cryptographic idempotency keys (hash of deviceId + cardUid + timestamp) and executing atomic daily-status upserts at the database layer.
- Designed automated integration test suites executed against live local PostgreSQL test containers, intercepting silent Prisma P2002 unique-constraint crashes to return proper HTTP 409 Conflict statuses and discovering case-sensitivity mismatches during email normalization.

Regexium - Real-Time Regular Expression Evaluator **Open-Source Engine**

Frontend & Compiler Engineering

TypeScript, Vue 3, Vite, Deterministic State Machines, Unit Testing

- Developed an interactive regular expression evaluation engine in TypeScript that decomposes complex regex syntax strings into deterministic match states and visually inspectable step-by-step evaluations.
- Penned dedicated edge-case test suites covering catastrophic backtracking risks, greedy vs. lazy quantifiers, lookaheads, nested capture groups, and malformed escape patterns.
- Enforced comprehensive TypeScript interfaces and discriminated unions across the tokenizer layer, ensuring end-to-end type soundness and elimination of unexpected runtime undefined states.

Stride - Academic Productivity & Course Platform **Full-Stack Application**

Full-Stack Developer

React, Node.js, Express, MongoDB, Asynchronous Controllers, RESTful APIs

- Engineered a modular full-stack course and workflow management suite utilizing a React client and a decoupled Node.js/Express service layer.
- Structured high-performance MongoDB embedded document schemas for course modules, study schedules, and mood logs to maximize read locality and minimize costly multi-collection queries.
- Authored isolated server-side controllers with strict input validation to handle malformed requests, prevent uncaught exceptions, and maintain consistent HTTP status reporting.
